This listing of claims will replace all prior versions, and listings, of claims in the application.

**Listing of Claims:**

1.      (currently amended)   A method for replicating a master file, the method comprising:

providing at a client computing device an interface that enables a user to select the master file for replication; and

replicating a change to the master file from the master file at the client computing device to a replica at a connected server computing device a change to the master file.

2.      (currently amended)   The method of claim 1, further comprising replicating at the client computing device from the connected server computing device a change to a replica of the master file.

3.      (original)      The method of claim 2, comprising replicating at the client computing device the change to the replica according to a conflict resolution scheme.

4.      (original)      The method of claim 3, comprising replicating at the client computing device the change to the replica if the change to the replica does not conflict with the master file.

5.      (canceled)

6.      (original)      The method of claim 1, comprising replicating the change to the master file in response to an event occurring at the client computing device.

7.      (currently amended)   The method of claim 6, comprising replicating the change to the master file in response to one member of a group comprising an expiration of a selected time interval, closing the master file at the client device, saving the master file at the client device, and shutting down the client device.

8.      (currently amended)   The method of claim 1, comprising replicating the change to the master file in response to a request from the connected <u>server</u> ~~computing device~~.

9.      (original)      The method of claim 1, comprising providing at a client computing device an interface that enables a user to select a portion of the master file for replication.

10.     (original)      The method of claim 1, further comprising providing at a client computing device an interface that enables a user to select a security option for replication of the master file.

11.     (original)      The method of claim 1, further comprising providing at a client computing device an interface that enables a user to select a security option for replication of selected a portion of the master file.

12.     (canceled)

13.     (currently amended)   A method for replicating a master file, the method comprising:
        replicating <u>a change to the master file</u> from <u>the master file at</u> a client computing device to a replica <u>at a connected server</u> ~~a change to the master file~~, the client computing device providing an interface enabling a user to select the master file for replication; and
        replicating <u>a change to the replica from the replica at the connected server</u> to <u>the master file at</u> the client computing device ~~a change to the replica~~.

14.     (canceled)

15.     (original)      The method of claim 13, comprising replicating to the client computing device the change to the replica according to a conflict resolution scheme.

16.    (original)    The method of claim 15, comprising replicating to the client computing device the change to the replica if the change to the replica does not conflict with the master file.

17.    (original)    The method of claim 13, comprising replicating the change to the master file in response to an event occurring at the client computing device.

18.    (currently amended)   The method of claim 17, comprising replicating the change to the master file in response to one <u>member</u> of <u>a group comprising</u> an expiration of a selected time interval, closing the master file at the client device, saving the master file at the client device, and shutting down the client computing device.

19.    (original)    The method of claim 13, further comprising requesting replication of the change to the master file in response to a command from another client computing device.

20.    (original)    The method of claim 13, further comprising replicating to another client computing device the change to the master file.

21.    (original)    The method of claim 13, further comprising replicating from another client computing device the change to the replica.

22.    (original)    The method of claim 13, further comprising providing a security option for the master file enabling the change to the master file to be replicated.

23.    (original)    The method of claim 13, comprising replicating a change to a portion of the master file selected for replication.

24.    (original)    The method of claim 23, further comprising providing a security option for the portion of the master file enabling the change to the portion of the master file to be replicated.

25.     (canceled)

26.     (currently amended)   A system for replicating a master file, the system comprising:

a client computing device <u>comprising a master file, the client computing device</u> providing a user interface that enables a user to select the master file for replication, the client computing device replicating a change to the master file <u>from the master file at the client computing device</u> to a <u>replica at a</u> connected <u>server</u> ~~computing device~~; and

the connected computing device replicating from the <u>master file at the</u> client computing device to <s>a</s> <u>the</u> replica <u>at the connected server</u> the change to the master file.

27.     (original)      The system of claim 26, wherein the client computing device replicates the change to the master file in response to an event occurring at the client computing device.

28.     (currently amended)   The system of claim 27, wherein the event is one <u>member</u> of <u>a</u> <u>group comprising</u> an expiration of a selected time interval, closing the master file at the client device, saving the master file at the client device, and shutting down the client device.

29.     (currently amended)   The system of claim 26, wherein the client computing device replicates the change to the master file in response to a request from the connected <u>server</u> ~~computing device~~.

30      (original)      The system of claim 26, wherein the client computing device replicates to the master file a change to the replica.

31.     (original)      The system of claim 30, wherein the client computing device replicates to the master file a change to the replica according to a conflict resolution scheme.

32.     (canceled)

33.     (original)      The system of claim 26, wherein the server replicates to a replication client the change to the master file.

34.     (original)     The system of claim 26, wherein the server replicates from a replication client the change to the replica.
